1. Introduction

Data protection is an important part of modern business. Companies collect different types of personal information from customers, employees and other users. This information must be handled carefully and securely. A Privacy Policy explains how an organisation collects, processes, stores and protects personal information. It also informs users about their privacy rights and how their information is handled. Effective data protection helps organisations prevent misuse of information, reduce security risks and maintain the confidence of their stakeholders.

2. Objectives

The main objectives of data protection are:

- To understand the importance of protecting personal information.
- To identify different types of personal data handled by an organisation.
- To understand how data is collected, processed and stored.
- To identify possible privacy and security risks.
- To understand the responsibilities of employees in protecting data.
- To improve privacy and data security practices.

3. Principles and Standards of Data Protection

Purpose Limitation:

Data should be collected for specific and clearly defined purposes.

Data Minimisation:

An organisation should collect only the information required for its business purpose.

Accuracy:

Personal information should be accurate and updated whenever necessary.

Confidentiality:

Personal information should be protected from unauthorised access and disclosure.

Accountability:

The organisation should take responsibility for following data protection requirements and maintaining proper controls.

4. Privacy, Ethics and Governance Framework

Privacy:

Privacy protects individuals from improper collection and use of their personal information.

Ethics:

Employees should handle personal information honestly, fairly and responsibly.

Governance:

Data governance provides rules and responsibilities for managing information within the organisation.

Employee Awareness:

Employees should receive proper training about privacy policies, security practices and responsible data handling.

Security Controls:

Organisations can use authentication, access restrictions, encryption and monitoring to protect information.

5. Policy Interpretation and Data Protection Analysis

Policy interpretation involves understanding the requirements of an organisation's privacy policy and applying them correctly in daily activities. Data protection analysis examines how personal information is collected, processed, stored and transferred.

Data Collection:

The organisation should identify what personal information is collected and the reason for collecting it.

Data Processing:

The organisation should ensure that personal information is processed only for legitimate business purposes.

Data Storage:

Information should be stored using appropriate security measures.

User Access:

Access to personal information should be provided only to authorised individuals.

Data Transfer:

Information transferred between systems or organisations should be protected against unauthorised access.

6. Company Review – Infosys

Infosys is a global information technology company that provides digital services, consulting and technology solutions to clients. As an IT organisation, Infosys handles different types of information related to employees, customers and business operations. Protecting this information is important for maintaining confidentiality and business trust. Infosys uses privacy and security practices to manage information responsibly. Data access should be controlled based on authorised business requirements. Security measures help reduce the risk of unauthorised access, data loss and misuse. The company also needs continuous monitoring, employee awareness and regular policy updates to address changing privacy and cybersecurity risks.

7. Preparing a Privacy Policy Review Report

A Privacy Policy Review Report presents the findings of an organisation's privacy policy assessment.

Company Information:

Provide the name and brief background of the organisation.

Privacy Policy:

Explain the purpose and scope of the organisation's privacy policy.

Information Collected:

Identify the major categories of personal information handled by the organisation.

Data Processing:

Review how the organisation uses and processes personal information.

Risk Assessment:

Identify possible privacy and security risks.

Recommendations:

Suggest improvements such as employee training, stronger access controls, regular audits and policy updates.

8. Conclusion

Data protection is essential for organisations that handle personal and business information. A well-designed privacy policy helps users understand how their information is handled and provides a framework for responsible data management. For a technology company such as Infosys, strong privacy practices, security controls, employee awareness and regular policy reviews are important for protecting information. Effective data protection reduces privacy risks and supports trust, accountability and responsible business operations.
